

Healthy Leaf

Report

Features, Architecture & Implementation

Course: WBA

Team Members: Naif ALrashed, Tamim ALghamdi, Saud ALjeharian, Nasser Alawdah

1. What are we solving

Healthy Leaf is a website that solves the problem of a store that has physical store but no online website which lead to loss of customers.

2. Technology Used

Technology	Version / Source	Purpose
HTML5	Standard	Page structure and semantic markup
CSS3	Custom (style.css)	Visual styling with CSS variables and Flexbox/Grid
JavaScript (ES5)	Vanilla, no frameworks	DOM manipulation, localStorage, event handling
Google Fonts	Noto Sans Arabic, Playfair Display	Typography for body text and headings
Font Awesome 6.5	CDN	Icon library for UI elements
localStorage API	Browser built-in	User session, cart persistence, order history

3. Features

3.1 Home Page (index.html)

The home page acts as the main entry point for visitors. It shows the three main features of the platform which are Personalized Plans Expert Trainers and Meal Delivery.

3.2 Diet Trainer Page (trainers.html)

This page shows four trainer profiles using a responsive grid layout. Each trainer card contains the expert photo their full name their specialization a short biography a star rating out of five the total session count and a Book a Session button. The trainer data is hardcoded directly into the HTML file instead of being generated by JavaScript. The reason for choosing this method on purpose to keep the code simple. Every trainer card uses the shared card class for consistent styling. The Book a Session buttons use inline onclick handlers with the alert function.

3.3 Custom Meals Page (custom-meals.html)

The Custom Meals page is the most interactive part of the application.

Users can add or remove items by clicking the Add or Remove buttons.

The table at the bottom of the sidebar calculates and shows total calories protein carbs fat and fiber in real time. meals.js script manages all the interactivity.

3.4 About Us Page (about.html)

The About page gives background information about the project mission and team members. The team section uses the exact same card and grid components as the features section on the home page. It displays four student cards.

3.5 Login Page (login.html)

The login page provides a simple auth form with username and password input fields. When the login is successful the user data is stored as a JSON in localStorage. Errors appear inline directly below the form instead of using an alert popup.

4. File Structure

File	Type	Description
index.html	HTML	Home page with sections and feature cards
trainers.html	HTML	Trainer profile grid with booking buttons
custom-meals.html	HTML	Meal builder with ingredient selection
about.html	HTML	Project mission and team member cards
login.html	HTML	Login form
styles/style.css	CSS	Single stylesheet with CSS variables, utilities, and component styles
scripts/main.js	JS	getCurrentUser() and logout() functions
scripts/login.js	JS	Login form handler, credential validation, localStorage session creation
scripts/meals.js	JS	Food list rendering, cart management, order placement

File	Type	Description
Assets/	images	This folder contains all images used

5. Data Management

All data in Healthy Leaf is stored in the browser's localStorage, which provides persistent key-value storage without requiring a server.

The data model uses three types of localStorage keys:

Key Pattern	Example	Content	Used By
healthyLeafUser	healthyLeafUser	{ username, isLoggedIn }	main.js, login.js, meals.js
cart_<username>	cart_testUser	[{ id, name, cal, protein, ... }]	meals.js
orders_<username>	orders_testUser	[{ username, items, totalCalories, date }]	meals.js

All localStorage reads are wrapped in try and catch blocks to handle corrupted or missing data gracefully. When JSON.parse() fails, the catch block either removes the corrupted key (for user sessions) or defaults to an empty array (for cart and order data).
